SEMMCO OXYGEN AND NITROGEN TROLLEYS MAKE LIGHT WORK OF REPLENISHING SUPPLIES

When servicing aircraft between flights, in a fast-paced and busy environment, it is important that ground staff are provided with the correct equipment to carry out their jobs in a safe and timely manner. Semmco, a leading UK engineering company providing a range of ground support and access solutions for the aviation maintenance market, has developed a series of Oxygen

and Nitrogen Cylinder Trolleys which enable engineers to replenish supplies to the aircraft easily and rapidly.

With efficiency and accuracy a vital factor in ground handling services, the Oxygen and Nitrogen Trolleys simplify the process of loading and unloading cylinders and eliminate transportation issues, minimising the overall turnaround time. The trolley system means that no lifting equipment is required, thus ensuring the loading and unloading can be carried out quickly and safely, whilst compliant with health and safety manual handling requirements. The optional gas booster can be fitted to allow the maximum amount of oxygen or nitrogen to be used from the cylinder, reducing costs and the amount of times gas levels need to be refilled, making it a very cost-efficient benefit.

The cylinders are cradle mounted and securely strapped to the cradle in the vertical position and when rotated to the horizontal they are position clamped to the trolley, which ensures a double locking system for securing the cylinders in place. The Semmco Oxygen and

Nitrogen Cylinder Trolleys are available in two cylinder fixed or demountable, three cylinder fixed and four cylinder fixed configurations.

The Semmco Oxygen and Nitrogen Trolleys feature a three year maintenance free control panel and the retractable hose reel means storage and stowage is better, resulting in longer life and less overall damage.
